#### 1.1.2.1 int Mat\_CalcSingleSubscript (int rank, int \* dims, int \* subs)

Calculates a single linear subscript (0-relative) given a 1-relative subscript for each dimension. The calculation uses the formula below where index is the linear index, s is an array of length RANK where each element is the subscript for the correspondind dimension, D is an array whose elements are the dimensions of the variable.

$$index = \sum_{k=0}^{RANK-1} [(s_k - 1) \prod_{l=0}^{k} D_l]$$

#### **Parameters:**

rank Rank of the variable

dims dimensions of the variable

subs Dimension subscripts

#### **Returns:**

Single (linear) subscript

#### 1.1.2.2 int\* Mat\_CalcSubscripts (int rank, int \* dims, int index)

Calculates 1-relative subscripts for each dimension given a 0-relative linear index. Subscripts are calculated as follows where s is the array of dimension subscripts, D is the array of dimensions, and index is the linear index.

$$s_k = \left\lfloor \frac{1}{L} \prod_{l=0}^k D_l \right\rfloor + 1$$
 
$$L = index - \sum_{l=k}^{RANK-1} s_k \prod_{m=0}^k D_m$$

#### 1.1.2.4 mat\_t\* Mat\_Create (const char \* matname, const char \* hdr\_str)

If a header string is given, at most the first 116 characters is written to the file. The given header string need not be the full 116 characters, but MUST be NULL terminated.

#### **Parameters:**

```

A newly allocated matvar\_t

# 1.1.2.10 matvar\_t\* Mat\_VarCreate (const char \* name, int class\_type, int data\_type, int rank, int \* dims, void \* data, int opt)

Creates a MAT variable that can be written to a Matlab MAT file with the given name, data type, dimensions and data. Rank should always be 2 or more. i.e. Scalar values would have rank=2 and dims[2] =  $\{1,1\}$ . Data type is one of the MAT\_T types. MAT adds MAT\_T\_STRUCT and MAT\_T\_CELL to create Structures and Cell Arrays respectively. For MAT\_T\_STRUCT, data should be a NULL terminated array of matvar\_t \* variables (i.e. for a 3x2 structure with 10 fields, there should be 61 matvar\_t \* variables where the last one is NULL). For cell arrays, the NULL termination isn't necessary. So to create a cell array of size 3x2, data would be the address of an array of 6 matvar\_t \* variables.

EXAMPLE: To create a struct of size 3x2 with 3 fields:

```
int rank=2, dims[2] = {3,2}, nfields = 3;
matvar_t **vars;

vars = malloc((3*2*nfields+1)*sizeof(matvar_t *));
vars[0] = Mat_VarCreate(...);
:
vars[3*2*nfields-1] = Mat_VarCreate(...);
vars[3*2*nfields] = NULL;
```

#### EXAMPLE: To create a cell array of size 3x2:

```
int rank=2, dims[2] = {3,2};
matvar_t **vars;

vars = malloc(3*2*sizeof(matvar_t *));
vars[0] = Mat_VarCreate(...);
:
vars[5] = Mat_VarCreate(...);
```

#### **Parameters:**

name Name of the variable to create

```
class_type class type of the variable in Matlab(one of the mx Classes)
data_type data type of the variable (one of the MAT_T_Types)
rank Rank of the variable
dims array of dimensions of the variable of size rank
data pointer to the data
opt 0, or bitwise or of the following options:
```

- MEM\_CONSERVE to just use the pointer to the data and not copy the data itself. Note that the pointer should not be freed until you are done with the mat variable. The Mat\_VarFree function will NOT free data that was created with MEM\_CONSERVE, so free it yourself.
- MAT\_F\_COMPLEX to specify that the data is complex. The data variable should be a contigouse piece of memory with the real part written first and the imaginary second
- MAT\_F\_GLOBAL to assign the variable as a global variable
- MAT F LOGICAL to specify that it is a logical variable

#### **Returns:**

A MAT variable that can be written to a file or otherwise used

#### 1.1.2.11 int Mat\_VarDelete (mat\_t \* mat, char \* name)

#### **Parameters:**

```
mat Pointer to the mat_t file structure
name Name of the variable to delete
```

#### **Returns:**

0 on success

#### 1.1.2.12 matvar\_t\* Mat\_VarDuplicate (const matvar\_t \* in, int opt)

Provides a clean function for duplicating a matvar\_t structure.

#### **Parameters:**

```
in pointer to the matvar_t structure to be duplicated
```

opt 0 does a shallow duplicate and only assigns the data pointer to the duplicated array. 1 will do a deep duplicate and actually duplicate the contents of the data. Warning: If you do a shallow copy and free both structures, the data will be freed twice and memory will be corrupted. This may be fixed in a later release.

#### **Returns:**

Pointer to the duplicated matvar\_t structure.

#### 1.1.2.13 void Mat\_VarFree (matvar\_t \* matvar)

Frees memory used by a MAT variable. Frees the data associated with a MAT variable if it's non-NULL and MEM\_CONSERVE was not used.
